

**January 21, 2003 – For Immediate Release**

**filePro Plus makes data conversion a breeze for this business and dynamic HTML pages a snap**

filePro Plus® is the development tool of choice for a leading service company to the Insurance Industry. They must be able to collect data from insurance companies, convert it into a “To Do” database using a large assortment of filePro Plus® conversion tools. In 1988, they found filePro Plus® and it has been used to manage billing, data conversion and formatting ever since. These files are collected via web postings, email, cut & paste screens, CSV files and documents. filePro Plus® has the tools necessary to convert the data contained in these documents to a common format for processing. In the last year, we have added the capability to make the some of the information available on the web. This was easily accomplished with fpCGI (an application that easily interfaces web GET/POST data to a filePro Plus® database, replacing difficult, custom perl scripts). We used filePro Plus® to generate dynamic HTML pages – giving the client the information, that they requested, from data archives quickly, securely and easily.

\*This customer requested their name be kept out of this press release so their competition would not find out what makes them so flexible.

filePro Plus® has been used world-wide by developers needing a powerful cost effective cross-platform system to develop database applications in just about every industry imaginable. filePro® is known for its ability to handle very large record and database sizes. filePro® has been installed on systems with as few as a single user to hundreds of users. Supported platforms include Windows®, SCO Unix, Linux, Sun Solaris, HP-UX, and IBM’s AIX and eServer iSeries. filePro developers can develop on their platform of choice and deploy runtime versions on multiple platforms.
